Brainstorming & Idea Prioritization Template

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	3 Marks

Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

S.No	Team Member	Idea / Suggestion	Category	Group No.
1	Team Member 1	Detect the ticket category from keywords in the short description	Classification	1
2	Team Member 2	Auto-fill subcategory based on description keywords	Classification	1
3	Team Member 3	Send unmatched tickets to a manual triage queue as a fallback	Classification	1
4	Team Member 4	Auto-assign the ticket to an assignment group based on category	Routing	2
5	Team Member 1	Assign to the least-loaded available agent in the group	Routing	2
6	Team Member 2	Set priority automatically from impact and urgency	Prioritization	3
7	Team Member 3	Escalate tickets containing outage keywords such as 'down' or 'not working'	Prioritization	3
8	Team Member 4	Notify the caller when the ticket is classified and assigned	Notification	4
9	Team Member 1	Notify the assignment group when a new ticket arrives	Notification	4
10	Team Member 2	Dashboard of ticket volume and classification accuracy	Reporting	5
11	Team Member 3	Add a work note recording how the ticket was classified	Reporting	5
12	Team Member 4	Use Predictive Intelligence (machine learning) for classification	Advanced / AI	6

Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final idea(s) to move forward with.

Group No.	Final Idea	Feasibility (High/Medium/Low)	Importance (High/Medium/ Low)	Priority	Selected (Yes/No)
1	Rule-based auto classification in Flow Designer (category, subcategory, fallback queue)	High	High	1	Yes
2	Auto-assignment to the correct assignment group	High	High	2	Yes
3	Auto priority setting and escalation of urgent tickets	High	Medium	3	Yes
4	Notifications to caller and assignment group	High	Medium	4	Yes
5	Classification reporting dashboard and work notes	Medium	Medium	5	No (future scope)
6	Predictive Intelligence based ML classification	Low	High	6	No (future scope)

Selected Ideas and Reasoning

Groups 1 to 4 are selected because together they form a complete, working flow: a ticket is created, classified, given a priority, routed to the right group, and both the caller and the group are informed. All four can be built with native Flow Designer triggers, conditions, actions and notifications, so the effort is realistic for the project timeline.

Groups 5 and 6 are important but are deferred. The reporting dashboard adds value only after the flow has produced data, and Predictive Intelligence needs a large set of well-labelled historical tickets and extra training effort, so it is kept as future scope.

Final solution direction: a Flow Designer flow triggered when an Incident is created, which classifies the ticket using short-description keywords, sets priority, assigns the ticket to the matching group, and sends notifications, with a manual triage queue for anything it cannot classify.
