Coding & Solution

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Repository Link / URL	[Paste your GitHub / GitLab link here]
Programming Language(s)	JavaScript (server-side scripts in ServiceNow) and Flow Designer low-code logic
Framework(s) Used	ServiceNow Flow Designer, Service Portal, ServiceNow platform tables and notifications
Key Features Implemented	• Incident creation through the Service Portal • Keyword-based auto classification (category and subcategory) • Automatic priority setting and assignment to the correct group • Manual triage queue for unmatched tickets • Notifications to caller and group, and a classification work note • Reporting dashboard and role-based access
Pending / Incomplete Features	• Machine-learning classification with Predictive Intelligence (future scope) • Automatic learning of new keywords from reclassified tickets (future scope)
Setup / Run Instructions	1. Sign in to a ServiceNow Personal Developer Instance. 2. Import the exported Update Set and commit it. 3. Open the Classification Rules table and check the keyword rules. 4. Open Flow Designer and make sure the flow is Active. 5. Create a test incident, for example 'VPN not connecting'. 6. Check that category, priority, group and the work note are set and notifications are sent.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

The whole solution runs inside ServiceNow, so the 'code' is the Flow Designer flow, the keyword rules table and the script step shown below. Rules can be changed in the table without editing the flow. Tickets that cannot be matched or that hit an error still reach the manual triage queue.

Key Script Used in the Flow (Keyword Match Action)

Field names such as u_classification_rule are examples and should match your own rules table.

```
(function execute(inputs, outputs) {
    // Match the ticket text against active keyword rules (highest weight first)
    outputs.matched = false;
    try {
        var text = ((inputs.short_description || '') + ' ' +
                    (inputs.description || '')).toLowerCase();

        var rule = new GlideRecord('u_classification_rule');
        rule.addActiveQuery();
        rule.orderByDesc('u_weight');
        rule.query();

        while (rule.next()) {
            var keyword = rule.getValue('u_keyword').toLowerCase();
            if (text.indexOf(keyword) > -1) {
                outputs.category = rule.getValue('u_category');
                outputs.subcategory = rule.getValue('u_subcategory');
                outputs.assignment_group = rule.getValue('u_assignment_group');
                outputs.matched = true;
                return;            // first (best) match wins
            }
        }
    } catch (e) {
        gs.error('Auto Ticket Classification failed: ' + e.message);
    }
})(inputs, outputs);
```
