Customer Journey Map

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Customer: an employee raising an IT incident.

Phase of Journey	**Stage 1: Raise Ticket**	**Stage 2: Auto Classification & Routing**	**Stage 3: Resolution & Follow-up**
Actions *What does the customer do?*	• Employee runs into an IT issue, for example VPN not connecting • Opens the Service Portal and clicks Create Incident • Types a short description and details, then submits	• Flow Designer starts when the incident is created • Flow matches keywords, sets category, subcategory and priority • Ticket is assigned to the matching group; unmatched tickets go to the triage queue	• Assigned agent opens a ticket that is already classified • Agent works on the issue and updates the status • Employee reads the resolution and confirms or closes the ticket
Touchpoint *What part of the service do they interact with?*	• Service Portal / Employee Center • Incident form • Email confirmation with incident number	• Flow Designer flow • Classification Rules table • Assignment group and incident record	• Agent Workspace / Incident form • Email and portal notifications • Ticket status page
Customer Thought *What is the customer thinking?*	• "I just need this fixed quickly." • "Which category do I pick?" • "Will anyone notice my ticket soon?"	• "Has my ticket been received?" • "I hope it reaches the right team." • "I do not want to be transferred around."	• "Good, it went to the right person." • "Is it fixed properly?" • "That was quicker than last time."
Customer Feeling *What is the customer feeling?*	Frustrated but hopeful	Uncertain at first, then reassured once the notification arrives	Relieved and satisfied

Process Ownership *Who is in the lead on this?*	Employee (caller), supported by the Service Desk	ServiceNow Admin / Flow developer, with the Service Desk Manager approving rules	Support agent of the assignment group; IT Manager monitors SLAs
Opportunities *How can we improve this stage?*	• Let users leave the category blank because the flow fills it in • Add examples under the short description field • Show the incident number straight after submit	• Keep keyword rules updated through the rules table • Keep a triage queue and a work note for unmatched tickets • Consider Predictive Intelligence in future	• Add a dashboard of classification accuracy • Collect a short satisfaction rating on closure • Use reclassified tickets to improve the rules

Journey Summary

Today the employee's experience is weakest after the ticket is raised: the category is guessed, the ticket may sit in the wrong queue, and there is no update. With auto classification, the ticket is sorted and routed within seconds of creation, the employee is told it has been received, and the agent starts with a correctly categorised ticket. This lifts the customer's feeling from frustrated to satisfied across the three stages.
