Empathy Map

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

Persona 1: the person who triages every incoming ticket by hand.

SAYS

- "I spend the first few minutes of every ticket just deciding where it belongs."
- "This ticket landed in the wrong queue again."
- "Which group handles VPN and access issues?"

THINKS

- "If the category was set automatically, I could start resolving right away."
- "A wrong category or priority will put my SLA at risk."
- "Users never pick the right category."

RIYA
(Service Desk Agent / L1 Support)

DOES

- Reads each new incident and manually selects category, subcategory and priority
- Reassigns tickets to other groups when they are misrouted
- Contacts users for missing details
- Keeps checking the queue for tickets close to SLA breach

FEELS

- Overwhelmed by the daily ticket volume
- Frustrated by repetitive, manual triage work
- Anxious about SLA breaches
- Satisfied when a ticket reaches the right team on the first attempt

Persona 2: the person who raises tickets and waits for a fix.

SAYS

- "I raised a ticket two hours ago and nobody has picked it up."
- "I am not sure which category to choose."
- "Why was my ticket moved to another team?"

THINKS

- "The category list is confusing, so I will just pick any option."
- "IT will fix it faster if it reaches the right team."
- "I have no idea whether anyone is working on this."

ARJUN
(Employee / End User)

DOES

- Submits tickets with a short description and a random or default category
- Calls or chats with the service desk to ask for status
- Raises duplicate tickets when there is no response

FEELS

- Frustrated by delays and ticket transfers
- Uncertain about progress and resolution time
- Reassured when the ticket is acknowledged and assigned quickly

Key Insights from the Empathy Maps

Pain Points	Opportunity for the Flow
Manual triage consumes agent time on every ticket.	Flow Designer reads the short description on ticket creation and sets category and subcategory automatically.
Wrong category leads to wrong assignment group and repeated transfers.	Category-to-group rules assign the ticket to the correct group at creation.
Users cannot tell whether their ticket was received or routed.	Automatic notification confirms classification and assignment to the user.
Urgent issues can sit unnoticed in a general queue.	Priority rules flag outage keywords and VIP callers for immediate attention.
