Performance Testing

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how your system behaves under expected and peak load conditions. Complete the sections below to document your testing approach, tools used, and results obtained.

Step 1: Testing Overview

Field	Details
Testing Tool Used	Apache JMeter (sends HTTP requests to the ServiceNow Table API)
Type of Testing	Load Testing, with a short Spike Test
Target Module / API	Auto ticket classification flow, triggered by creating an incident through POST /api/now/table/incident
Test Environment	Cloud: ServiceNow Personal Developer Instance
Test Date	*[Enter the date you run the tests]*

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Baseline: one user creates a single incident and the flow classifies it	1	60	Ticket classified within 5 seconds, no errors
2	Normal load: users create incidents at a steady rate	10	120	Average response under 2 seconds; error rate under 1%; all tickets classified
3	Peak load: heavier steady load during busy hours	25	180	Max response under 5 seconds; error rate under 1%; no ticket left unclassified
4	Spike: sudden burst of incidents at once	50	60	No tickets lost; every ticket is classified or sent to the triage queue

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds			
2	Response Time (Max)	< 5 seconds			
3	Throughput (Req/sec)	At least 5 req/sec			
4	Error Rate	< 1%			
5	CPU Utilization	< 80%			
6	Memory Utilization	< 80%			
7	Flow Classification Time (incident created to category set)	< 5 seconds			

Step 4: Observations & Analysis

Key Findings:

[Describe what the test results revealed about your system's performance, for example the average response time and how long classification took at 10, 25 and 50 users]

Bottlenecks Identified:

[List any bottlenecks seen, for example slow keyword matching with many rules, or throttling by the developer instance]

Optimization Steps Taken:

[Describe any changes made, for example ordering rules by weight, keeping the rules table small, or adding an index on the keyword field]

Step 5: Screenshots / Evidence

Attach screenshots of your performance testing tool results below (e.g., JMeter report, Locust graphs, k6 output):

[Insert Screenshot 1 here: JMeter Summary Report]

[Insert Screenshot 2 here: Flow Designer executions list]

[Insert Screenshot 3 here: Incident list showing categories set automatically]

Test Procedure (Reference)

1. Create a JMeter Thread Group for each scenario, using the users and durations in Step 2.
2. Add an HTTP Request that sends POST /api/now/table/incident with a short description such as 'VPN not connecting', using basic authentication.
3. Add a Summary Report listener. Its average, max, throughput and error % fill metrics 1 to 4.
4. In ServiceNow, open Flow Designer > Executions to see how long each run took, and use it for metric 7.
5. Check that every test incident has a category, priority and assignment group set. Delete the test incidents afterwards.
6. For CPU and memory, use the instance statistics page if your role can see it. A developer instance is managed by ServiceNow, so write 'Not visible' in Remarks if it is not available.
