Problem-Solution Fit

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Problem-Solution Fit Canvas:

Use the framework below to ensure your proposed solution accurately addresses the root causes, behaviors, and limitations of your target audience. Fill out the canvas in the respective boxes just like the original visual template.

1. CUSTOMER SEGMENT(S) [CS]
- IT service desk agents (L1/L2) handling incoming incidents
- Employees who raise IT tickets
- IT managers responsible for SLAs

6. CUSTOMER LIMITATIONS
EG. BUDGET, DEVICES [CL]
- Agents have very little time per ticket
- Users are non-technical and unsure of categories
- Only platform-native tools, no extra budget for new software
- Access through a web browser (desktop or mobile)

5. AVAILABLE SOLUTIONS
PROS & CONS [AS]
- **Manual triage:** full human judgement, but slow and inconsistent
- **User-selected category:** simple, but often wrong
- **Predictive Intelligence (ML):** learns over time, but needs a large set of historical tickets

2. PROBLEMS / PAINS
+ ITS FREQUENCY [PR]
- Every new ticket needs manual categorising and routing (daily, every ticket)
- Tickets land in the wrong queue and get reassigned (frequent)
- Urgent tickets wait too long, so SLAs are missed (occasional, but costly)

9. PROBLEM ROOT / CAUSE [RC]
- Users guess the category or leave the default
- No automatic classification rules exist
- Category-to-group mapping is done by people
- Urgent keywords are not detected

7. BEHAVIOR
+ ITS INTENSITY [BE]
- Agents read, recategorise and reassign tickets by hand (high at peak hours)
- Users chase by phone or raise duplicate tickets (medium)

3. TRIGGERS TO ACT [TR]
- A new incident is created
- A ticket is misrouted or an SLA warning appears
- Backlog grows during peak hours

10. YOUR SOLUTION [SL]
- A Flow Designer flow that triggers when an incident is created
- Reads the short description and matches keywords from a rules table
- Sets category, subcategory and priority automatically
- Assigns the ticket to the right group and notifies the caller and group
- Unmatched tickets go to a manual triage queue, and a work note records the decision

8. CHANNELS OF BEHAVIOR [CH]

ONLINE
- ServiceNow Service Portal and incident form
- Email and portal notifications
- Reports and dashboards

4. EMOTIONS
BEFORE / AFTER [EM]
- **Before:** overwhelmed, frustrated, anxious about SLAs
- **After:** relieved, confident, in control

OFFLINE
- Phone calls to the service desk
- Walk-ups to the IT desk
- Verbal follow-ups with the team

How the Solution Fits the Problem

The canvas shows that the main pain is manual triage caused by unreliable, user-picked categories. The solution removes that root cause instead of only speeding up the manual step.

Root Cause / Pain	What the Solution Does	Expected Result
Users guess the category	Flow sets category and subcategory from the ticket description	Consistent, correct categorisation
Manual routing to groups	Category-to-group mapping assigns the ticket at creation	Fewer transfers and faster pickup
Urgent issues go unnoticed	Outage keywords raise priority automatically	Fewer SLA breaches
No visibility for the user	Notification to caller and group, plus a work note	Users know their ticket is received and routed

Why This Fit Works

The solution fits the customer's limits because it is built with tools already in the platform, needs no new device or software, and asks nothing extra from the user. It matches the behaviour we observed: agents can keep working in the same incident form and only step in when the flow sends a ticket to the triage queue.
