| Project Title | Auto Ticket Classification using Flow Designer |
| Team ID | SWTID-2026-6564 |
| Date | 29 September 2026 |
| Maximum Marks | 5 Marks |

## Project Proposal (Proposed Solution) report

The proposal report aims to improve IT support by automating ticket classification with ServiceNow Flow Designer, boosting speed and accuracy. It tackles manual triage and misrouting, promising faster response, fewer SLA breaches and happier users. Key features include rule-based auto classification and automatic assignment.

| **Project Overview** | |
|---|---|
| Objective | To automate the classification and routing of IT support tickets using a Flow Designer flow in ServiceNow, so tickets get the right category, priority and assignment group as soon as they are created. |
| Scope | The project covers incident tickets in ServiceNow: detecting the category from the description, setting priority, assigning the group and notifying users. Reporting is included at a basic level, and machine-learning classification is left for future work. |
| **Problem Statement** | |
| Description | Support agents classify and route every ticket by hand, and users often choose the wrong category. This causes misrouted tickets, repeated transfers, delayed responses and missed SLAs. |
| Impact | Solving this will cut manual triage time, reduce transfers, help urgent tickets get attention sooner and give users faster, more consistent support. |
| **Proposed Solution** | |
| Approach | Build a rule-based flow in Flow Designer, triggered when an incident is created. It matches keywords from a rules table, sets the ticket fields and assigns the group, with a fallback triage queue for tickets it cannot match. |
| Key Features | - Automatic category and subcategory assignment using keywords in the ticket description.<br>- Automatic priority setting, with escalation of urgent tickets such as outages.<br>- Automatic assignment to the correct assignment group.<br>- Notifications to the caller and the assignment group, and a work note recording each decision.<br>- Manual triage queue for tickets the flow cannot classify. |

**Resource Requirements**

| Resource Type | Description | Specification/Allocation |
|---|---|---|
| **Hardware** | | |
| Computing Resources | CPU/GPU specifications, number of cores | No local compute needed. Runs on a ServiceNow cloud instance; client PC with a modern browser |
| Memory | RAM specifications | 8 GB RAM on the client PC (recommended) |
| Storage | Disk space for data, models, and logs | Managed by the ServiceNow instance; about 1 GB local space for project documents |
| **Software** | | |
| Frameworks | Platform frameworks | ServiceNow Flow Designer, Service Portal |
| Libraries | Additional tools | Server-side JavaScript, Notifications, Reports and Dashboards, Update Sets |
| Development Environment | IDE | ServiceNow Personal Developer Instance in Google Chrome (Flow Designer, Studio) |
| **Data** | | |
| Data | Source, size, format | Sample incident tickets created in the instance (about 100), keyword rules table; ServiceNow tables, CSV for import |
