Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-6564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/ Medium/Low)
1	Authentication	Users sign in to the ServiceNow instance with their organisation credentials (username/password or SSO). Only authenticated users can raise incidents. The classification flow itself runs under a system context, so no user login is needed to execute it.	High
2	Authorization levels	**Employee / Caller:** create and view own incidents. **Service Desk Agent (itil):** view and update incidents assigned to their group. **Flow Admin (admin / flow_designer):** build, edit and activate flows and manage the keyword rules. **IT Manager:** view reports and dashboards.	High
3	External interfaces	No third-party API is needed for the core flow, as it runs inside ServiceNow. It uses the platform's email service for notifications and the Incident, User and Group tables. Future scope: Predictive Intelligence for machine-learning based classification.	Medium
4	Transactions processing	When an Incident is created, Flow Designer triggers, reads the short description and description, matches keywords, and updates category, subcategory, priority and assignment group in one record update. Any error is logged in flow execution details and the ticket goes to a manual triage queue.	High
5	Reporting	Reports and dashboards for tickets by category, tickets by assignment group, auto-classified versus manually classified tickets, and flow execution success/failure. Reports can be exported to CSV or PDF.	Medium

S.No	Requirement Category	Requirement Description	Priority (High/ Medium/Low)
6	Business rules, etc.	Keyword-to-category mapping is held in a rules table. Priority is derived from impact and urgency, and outage words such as 'down' or 'not working' raise priority. Each category maps to one assignment group. Tickets with no keyword match go to the Service Desk triage group. The flow skips tickets whose category is already set by an agent.	High
7	Compliance to laws or regulations	Follow the organisation's IT and data privacy policy. Ticket data is visible only to authorised roles through ACLs, and personal data stays inside the platform. Every automatic change is traceable through the activity log and work notes.	Medium
8	Other	A work note is added to each ticket stating how it was classified. The flow can be switched on or off with its Active flag, and is tested in a sub-production or developer instance before use.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Classification and assignment happen immediately after the incident is saved, without slowing down ticket creation.	Flow completes within 5 seconds of incident creation
2	Scalability	The flow handles growth in ticket volume, and new categories or keywords are added by editing the rules table, not the flow.	Supports at least 1,000 incidents per day; new keyword added with no flow change
3	Security & Data Privacy	Role-based access (ACLs) on incidents and rules. Data is protected in transit and stored inside the platform. The flow runs with only the access it needs.	100% of access over HTTPS; no unauthorised role can edit rules
4	Reliability & Availability	The flow must not lose or block a ticket. If classification fails, the ticket still reaches a manual queue.	99.9% availability per month (platform dependent); 0 tickets lost on flow failure
5	Usability & Accessibility	Users need no extra step, as they only describe the issue. Agents see classification details in a work note using the standard ServiceNow interface.	No mandatory category field for users; interface follows platform WCAG 2.1 AA standards
6	Other	Maintainability: flow is modular, named clearly and documented. Accuracy: classification is checked against sample tickets.	At least 85% correct category on test tickets
